HOORVIA - VLOOKUP GUIDE: PRINTABLE EXCEL LOOKUP CHART

Quick Reference Cheat Sheet · A4 Printable

Tech & Software · Sheet #1

Function / Formula	Standard Syntax	Practical Use Case	Key Return Value / Error Guard
VLOOKUP	=VLOOKUP(lookup_val, table, col, FALSE)	Vertical lookup in the first column	Returns the matching value; #N/A if not found
HLOOKUP	=HLOOKUP(lookup_val, table, row, FALSE)	Horizontal lookup in the first row	Returns the matching value from a row
XLOOKUP	=XLOOKUP(lookup_val, lookup_arr, return_arr, [if_not_found], [match_mode])	Bidirectional dynamic array lookup without column index	Returns matching cell; eliminates #N/A errors with fallback string
INDEX / MATCH	=INDEX(return_col, MATCH(lookup_val, lookup_col, 0))	Robust 2D table lookups resilient to column insertions	Exact match reference; works left-to-right and right-to-left
SUMIFS	=SUMIFS(sum_range, criteria_range1, criteria1, [criteria_range2, criteria2])	Multi-condition numerical aggregation	Sums all numeric cells satisfying all specified criteria filters
COUNTIFS	=COUNTIFS(criteria_range1, criteria1, [criteria_range2, criteria2])	Multi-condition frequency counting	Integer count of matching records across multiple criteria arrays
QUERY (Google Sheets)	=QUERY(data, "SELECT A, B WHERE C > 100 ORDER BY B DESC", 1)	SQL-like data transformation and manipulation in spreadsheets	Returns dynamic array table filtered and ordered by SQL syntax
VLOOKUP + IFERROR	=IFERROR(VLOOKUP(lookup_val, table, col, FALSE), "Not found")	Hides #N/A errors with a friendly message	Returns "Not found" instead of an error
MATCH	=MATCH(lookup_val, range, 0)	Finds a value's position in a list	Returns the row or column number
INDEX	=INDEX(range, row, col)	Returns a cell by its position	Returns the value at that position
CHOOSE	=CHOOSE(index, val1, val2, val3)	Picks a value by its number	Returns the nth value in the list
FILTER	=FILTER(range, condition)	Returns every matching row	Dynamic array of all matches

PRO TIP: Always use FALSE for exact match: VLOOKUP without FALSE returns the nearest value below - almost never what you wanted. Use FALSE for an exact match, every time.
