HOORVIA - BLENDER MODIFIERS CHEAT SHEET: PRINTABLE REFERENCE CHART

Quick Reference Cheat Sheet · A4 Printable

Tech & Software · Sheet #1

Modifier	Category	What It Does	Best Used For
Subdivision Surface	Generate	Subdivides the mesh to create a smoother, denser surface	Organic shapes, characters, and hard-surface models needing smooth curves
Mirror	Generate	Mirrors geometry across an axis for perfect symmetry	Characters, vehicles, and any symmetric object - model one half only
Array	Generate	Creates a line of copies along an axis or curve	Fences, stairs, repeated parts like bolts or fence posts
Boolean	Generate	Combines objects with union, difference, or intersection	Cutting holes and windows, merging parts into one mesh
Bevel	Generate	Chamfers edges to catch light and add realism	Hard-surface modeling - edges look fake without a small bevel
Solidify	Generate	Gives flat surfaces thickness and depth	Cloth panels, book pages, phone screens, any flat sheet
Displace	Deform	Moves vertices along normals using a texture	Terrain, wrinkles, and bumpy surfaces without manual sculpting
Curve	Deform	Deforms the mesh to follow a curve object	Roads, pipes, text along a path, roller-coaster tracks
Lattice	Deform	Deforms the mesh inside an editable lattice cage	Cartoon squash-and-stretch, reshaping whole characters
Shrinkwrap	Deform	Projects the mesh onto another surface	Cloth fitted to a body, decals and labels on curved surfaces
Decimate	Generate	Reduces polygon count while keeping the shape	Game assets, low-poly conversion, cleaning heavy scans
Remesh	Generate	Rebuilds topology as clean voxels or blocks	Preparing sculpts for clean topology, voxel-art style models

PRO TIP: Stack Order Matters: Place Mirror at the top of the stack, Subdivision in the middle, Bevel last - drag modifiers to reorder anytime.
