HOORVIA - PIP & VIRTUALENV CHART: PRINTABLE PYTHON ENVIRONMENT COMMANDS

Quick Reference Cheat Sheet · A4 Printable

Tech & Software · Sheet #1

Task	Command	What It Does	When to Use It
Create environment	python -m venv myenv	Creates a virtual environment folder	Once per project
Activate (Windows)	myenv\Scripts\activate	Activates the venv in CMD or PowerShell	Every new terminal
Activate (Mac / Linux)	source myenv/bin/activate	Activates the venv in bash or zsh	Every new terminal
Deactivate	deactivate	Exits the active venv	When switching projects
Install package	pip install requests	Installs a package into the venv	Adding dependencies
Install from file	pip install -r requirements.txt	Installs every package listed	Setting up a project
List packages	pip list	Shows installed packages and versions	Checking what is installed
Freeze requirements	pip freeze > requirements.txt	Writes exact versions to a file	Sharing a project
Upgrade pip	python -m pip install --upgrade pip	Updates pip itself	First setup, or pip warnings
Uninstall package	pip uninstall requests	Removes a package	Cleaning up
Check Python version	python --version	Shows the active Python version	Verifying the venv is active
Use a specific Python	python3.11 -m venv myenv	Builds the venv with that Python	Projects needing an older version

PRO TIP: Activate before installing: Packages installed without an active venv land in the system Python and pollute every project.
