HOORVIA - POUR OVER COFFEE CHART: PRINTABLE RATIO, GRIND & BREW GUIDE

Quick Reference Cheat Sheet · A4 Printable

Kitchen & Cooking · Sheet #1

Step / Setting	Value	Why	Tip
Ratio	1:16 (1 g coffee : 16 g water)	Balanced extraction	1:15 stronger, 1:17 lighter
Dose (1 cup)	15 g coffee, 250 g water	Single-cup standard	20 g / 320 g for a large mug
Dose (2 cups)	30 g coffee, 500 g water	Same 1:16 ratio scaled	Grind slightly coarser
Water temp	195-205°F (90-96°C)	Hot enough to extract, not scorch	Light roasts: hot end
Grind (V60)	Medium-fine, like table salt	Fast-draining cone needs finer grind	Too fast + sour = grind finer
Grind (Chemex)	Medium-coarse	Thick filter slows flow	Prevents stalling
Grind (Kalita Wave)	Medium	Flat bottom drains evenly	3-4 min total
Bloom	2-3x coffee weight, 30-45 sec	Releases CO2 before brewing	15 g coffee -> 30-45 g water
First pour	To half the water by ~1:15	Keeps the bed saturated	Pour in slow circles
Finish pour	All water by ~2:00-2:15	Even extraction	Keep the stream low and centered
Total brew (V60)	2:30-3:30 drawdown	Sweet spot for a cone	Bitter + slow = grind coarser
Total brew (Chemex)	3:30-5:00 drawdown	Thick filter, slower flow	Use medium-coarse grind

PRO TIP: Weigh everything: A scale beats scoops - 15 g of coffee and 250 g of water, every single time.
