HOORVIA - PYTHON METHODS CHEAT SHEET: PRINTABLE LIST, STRING & DICT GUIDE

Quick Reference Cheat Sheet · A4 Printable

Tech & Software · Sheet #1

Method	Example	What It Does	Returns
list.append(x)	my_list.append(4)	Adds one item to the end of the list	None
list.extend(iterable)	my_list.extend([5, 6])	Adds every item from another iterable	None
list.pop(i)	my_list.pop()	Removes and returns an item (last by default)	The removed item
list.sort()	my_list.sort(reverse=True)	Sorts the list in place	None
str.split(sep)	"a,b".split(",")	Splits a string into a list	list
str.join(iterable)	", ".join(["a", "b"])	Joins items into one string	str
str.strip()	" hi ".strip()	Removes leading and trailing whitespace	str
str.replace(old, new)	"cat".replace("c", "b")	Replaces every match with new text	str
dict.get(key, default)	my_dict.get("key", 0)	Safe lookup that never raises KeyError	Value or default
dict.items()	for k, v in my_dict.items():	Loops over key-value pairs together	dict_items view
dict.update(other)	my_dict.update({"a": 1})	Merges another dict into this one	None
set.add(x) / discard(x)	my_set.add(3)	Adds a member, or removes one safely	None

PRO TIP: Watch out for methods that return None: sort, append, and update change the object in place and return None - assigning their result to a variable gives you None, not the list.
